# Everything is better with friends: Executing SAS® code in Python scripts with SASPy

## **PYTHON CHEATSHEET (FOR SAS PROGRAMMERS)**

Python is a versatile programming language with syntax resembling DATA steps in SAS, but with the following important differences.

## **Capitalization matters**

```
print('Hello, World!') is not the same as PRINT('Hello, World!')
```

## Semicolons are only used when multiple statements are on the same line

```
message = 'Hello'
print(message)

is the same as message = 'Hello'; print(message)
```

## There are multiple, (mostly) interchangeable quoting styles

```
print('A') is the same as print("A"), print('''A'''), Or print("""A""")
```

## Assignment is different than equality testing

```
Assignment: fireworks = 'Yes!' Equality Testing: fireworks == 'Yes!'
```

## White space matters (and is used to determine scope)

```
if fireworks == 'Yes!': would produce an error with indentation removed print('\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overline{\overli
```

### REPLICATING HANDS-ON WORKSHOP EXAMPLES

**Step 1**: Download and install the freely available SAS University Edition. We recommend using VirtualBox: <a href="https://support.sas.com/software/products/university-edition/docs/en/SASUniversity-EditionQuickStartVirtualBox.pdf">https://support.sas.com/software/products/university-edition/docs/en/SASUniversityEditionQuickStartVirtualBox.pdf</a>

**Step 2**: Start SAS University Edition, and access JupyterLab within a web browser: <a href="https://support.sas.com/software/products/university-edition/faq/jn\_runvirtualbox.htm">https://support.sas.com/software/products/university-edition/faq/jn\_runvirtualbox.htm</a>

- **Step 3**: Download example file **SGF2019-HOW-Everything\_Is\_Better\_With\_Friends-examples.ipynb** from https://github.com/saspy-bffs/sgf-2019-how
- Step 4: Load example file into JupyterLab: https://jupyterlab.readthedocs.io/en/stable/user/files.html
- **Step 5**: Follow instructions in example file.

## REPLICATING HANDS-ON WORKSHOP DEMOS

Because Python<sup>1</sup> is community-driven, there is immense flexibility in how it can be used. The following is a short guide for setting up SASPy with the popular IDE PyCharm<sup>2</sup>. These instructions were developed using Windows 10 with SAS 9.4, Java SE version 8 update 201, Python 3.7.3, Git 2.21.0, and PyCharm Professional Edition 2019.1.1 installed. All default installation options are recommended.

#### Step 1: Setup development environment.

- a. Download and install Java SE (to be used by SASPy to invoke SAS) from https://www.java.com/
- b. Download and install Python (i.e., the CPython implementation) from https://www.python.org/
- c. Download and install Git (to be used by PyCharm's GitHub integration) from <a href="https://git-scm.com/">https://git-scm.com/</a>
- d. Download and install PyCharm from https://www.jetbrains.com/pycharm/.

### Step 2: Setup project in PyCharm.

- a. Start PyCharm, and when prompted, choose **Check out from Version Control** → **Git**, enter URL <a href="https://github.com/saspy-bffs/sgf-2019-how">https://github.com/saspy-bffs/sgf-2019-how</a>, choose a directory to copy the files to, and click **Clone**.
- b. Use the menu commands File → Settings → Project: sgf-2019-how → Project Interpreter. Then click the Gear Icon (♠) in the upper-right corner of the dialog box and select Add... This should prompt you to create a new virtual environment<sup>3</sup> as a subfolder named *venv* in your project folder. Once setup, click OK and, once processing has finished, click OK again to exit the dialog box.
- c. Use the menu command View  $\rightarrow$  Tool Windows  $\rightarrow$  Terminal to open a terminal window. (Alternatively, click **Terminal** at the bottom of the PyCharm window.) Then type the following at the command prompt and press Enter: **pip install** -r requirements.txt
  - Use the project-navigation area in the left-hand panel to open the file <code>sascfg\_personal-example.py</code> (i.e., double-click its name), and copy its contents to the system clipboard. Then use the menu command <code>File</code>  $\rightarrow$  <code>New</code>  $\rightarrow$  <code>Python File</code> to create a new file named <code>sascfg\_personal.py</code>, paste the contents of the system clipboard into it, and update to match your SAS installation setup per the instructions at <a href="https://sassoftware.github.io/saspy/install.html">https://sassoftware.github.io/saspy/install.html</a>.

#### Step 3: Run the example file.

a. Use the menu command Run → Run ... → SGF2019-HOW-Everything\_Is\_Better\_With\_Friends-examples.py, and then watch the output scroll by in the Run portion of bottom panel. (Alternatively, open SGF2019-HOW-Everything\_Is\_Better\_With\_Friends-examples.py by double-clicking its name in the project-navigation area in the left-hand panel, right-click anywhere inside the code editor window, and choose the command Run ' SGF2019-HOW-Everythi...')

**Step 4**: Repeat with a full-application example using the popular Python web framework Flask.

a. Use the menu command VCS → Checkout from version control → Git to create a new project from <a href="https://github.com/saspy-bffs/dataset-explorer">https://github.com/saspy-bffs/dataset-explorer</a> and repeat Step 2(b-d). Then run app.py, visit the URL <a href="http://127.0.0.1:8000/">http://127.0.0.1:8000/</a> in a web browser, and follow the instructions. (If SAS was installed with default options, try using the directory C:\Program Files\SASHome\SASFoundation\9.4\core\sashelp.)

<sup>&</sup>lt;sup>1</sup> When most people talk about the Python language, they mean the C-based *CPython* reference implementation at <a href="https://github.com/python/cpython">https://github.com/python/cpython</a>. Other implementations of the Python language specification include Java-based Jython (<a href="https://www.jython.org/">https://www.jython.org/</a>) and .NET-based Iron Python (<a href="https://ironpython.net/">https://ironpython.net/</a>). The CPython implementation can also be installed as part of the data-science oriented Anaconda distribution (<a href="https://www.anaconda.com/distribution/">https://www.anaconda.com/distribution/</a>).

<sup>&</sup>lt;sup>2</sup> You can choose between PyCharm Community Edition, which is free and open-source, and PyCharm Professional Edition, which requires a license after an initial demo period.

<sup>&</sup>lt;sup>3</sup> A virtual environment (aka venv) is essentially a completely separate installation of Python, which is cloned from the version of Python installed as Step 1(b). It's considered best practice to create a new venv for each project in order to keep its dependencies isolated from other projects having separate dependencies.
